

Note to Reader:

The BACM analysis and more specifically the BACT Reports for each of Major Stationary Point Sources located within the Salt Lake City, UT PM2.5 Nonattainment Area were already made available for public inspection when Part H of the SIP was released for public comment in July of 2018.

These documents will eventually become part of the overall TSD for the Serious Area PM2.5 SIP, and will be found in this portion of that TSD.

For now however, we refer the reader to our website where these source-specific BACT Reports are still available for inspection now in the context of Part A.

All of the files may be found at the following address:
